

DEFENSE INFORMATION SYSTEMS AGENCY

JOINT INTEROPERABILITY TEST COMMAND P.O. BOX 12798 FORT HUACHUCA, ARIZONA 85670-2798

Networks and Transport Division (JTE)

October 4, 2006

MEMORANDUM FOR DISTRIBUTION

SUBJECT: Special Interoperability Test Certification of the Secure Systems Group (SSG)

Optically Isolated Secure/Non-Secure Switch Video Switch (VSW) 431 with

Firmware Revision C

References: (a) DoD Directive 4630.5, "Interoperability and Supportability of Information Technology (IT) and National Security Systems (NSS)," 5 May 2004

(b) CJCSI 6212.01D, "Interoperability and Supportability of Information

Technology and National Security Systems," 8 March 2006

1. References (a) and (b) establish the Defense Information Systems Agency, Joint Interoperability Test Command (JITC), as the responsible organization for interoperability test certification. Additional references are provided in enclosure 1.

- 2. The SSG Optically Isolated Secure/Non-Secure Switch VSW 431 with firmware revision C is hereinafter referred to as the System Under Test (SUT). The SUT meets all of the critical interoperability requirements and is certified for joint use in the Defense Switched Network (DSN). The SUT was tested primarily to determine that it appeared transparent when connected between the Video Teleconferencing (VTC) equipment and the inverse multiplexer and had no adverse effect on 384 kilobits per second Bonding mode 1 VTC calls. JITC tested the SUT as set forth in appendix 8 of reference (c) using test procedures derived from reference (d). This certification expires upon changes that affect interoperability, but no later than three years from the date of this memorandum.
- 3. This certification is based on interoperability testing conducted by JITC at the Global Information Grid Network Test Facility, Fort Huachuca, Arizona, from 15 May through 5 June 2006. Final review of test data compliance was completed on 29 June 2006. The Certification Testing Summary (enclosure 2) documents the test results and describes the test configuration. Users should verify interoperability before deploying the SUT in an environment that varies significantly from that described.
- 4. The certification of the SUT is based upon evaluation of the platforms using the Capability Requirements (CRs) derived from reference (c). The CRs used to evaluate the interoperability of the application are listed in table 1.

JITC Memo, JTE, Special Interoperability Test Certification of the Secure Systems Group (SSG) Optically Isolated Secure/Non-Secure Switch Video Switch (VSW) 431 with Firmware Revision C

- 5. JITC distributes interoperability information via the JITC Electronic Report Distribution (ERD) system, which uses Unclassified-But-Sensitive Internet Protocol Router Network (NIPRNet) e-mail. More comprehensive interoperability status information is available via the JITC System Tracking Program (STP). The STP is accessible by .mil/.gov users on the NIPRNet at https://stp.fhu.disa.mil. Test reports, lessons learned, and related testing documents and references are on the JITC Joint Interoperability Tool (JIT) at https://jit.fhu.disa.mil (NIPRNet), or http://199.208.204.125 (SIPRNet). Information related to DSN testing is on the Telecom Switched Services Interoperability (TSSI) website at http://jitc.fhu.disa.mil/tssi.
- 6. The JITC point of contact is Mr. John Hooper, DSN 879-5041, commercial (520) 538-5041, FAX DSN 879-4347, or e-mail to John.Hooper@disa.mil. The tracking number for the SUT is 0605401.

CERTIFICATION TESTING SUMMARY

- **1. SYSTEM TITLE.** The Secure Systems Group (SSG) Optically Isolated Secure/Non-Secure Switch Video Switch (VSW) 431 with firmware revision C is hereinafter referred to as the System Under Test (SUT).
- 2. PROPONENT. Defense Information Systems Agency (DISA).
- **3. PROGRAM MANAGER.** Mr. Howard Osman, GS23, Room 5W23, 5275 Leesburg Pike, Falls Church, VA 22041, e-mail: Howard.Osman@disa.mil.
- 4. TESTER. Joint Interoperability Test Command (JITC), Fort Huachuca, Arizona.
- **5. SYSTEM UNDER TEST DESCRIPTION.** The SUT is an optically isolated secure/non-secure switch that offers secure Video Teleconferencing (VTC) users a solution for conducting both secure and non-secure VTC calls. The SUT includes dial isolator and a secure/non-secure switch that provides both physical and digital redundant checking. The mode is validated (secure or non-secure) by the SUT prior to allowing data to be transmitted. If the SUT is not properly configured for ether secure or non-secure calls, it will not allow the calls in either mode. Furthermore, the SUT includes an integrated secure/non-secure light emitting diode sign (on the front of the unit) which allows the user to easily see which mode is in current use. The SUT includes two internal slots to house an ADTRAN 512 Inverse Multiplexer and a KIV-7 encryption device.
- **6. OPERATIONAL ARCHITECTURE.** The Generic Switching Center Requirements (GSCR) Defense Switched Network (DSN) architecture in figure 2-1 depicts the relationship of the SUT to the DSN switches.

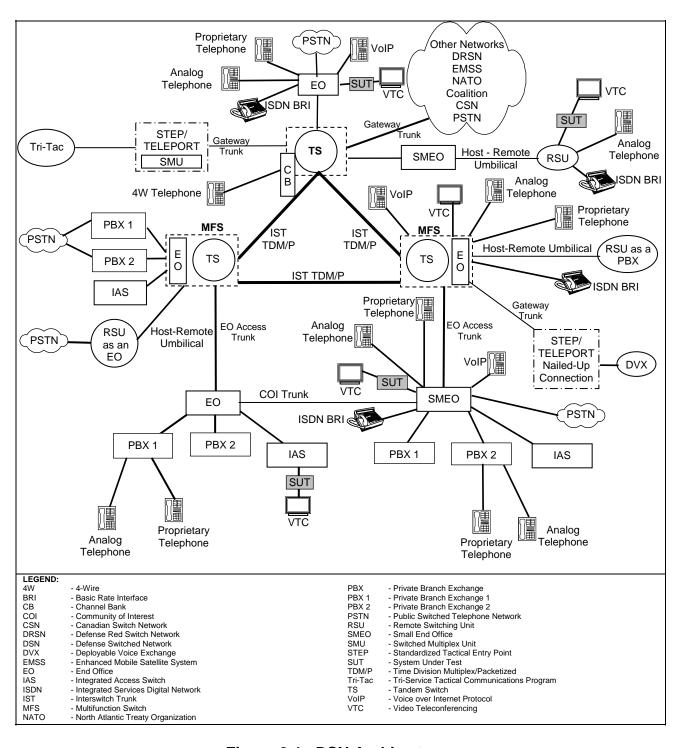

Figure 2-1. DSN Architecture

7. REQUIRED SYSTEM INTERFACES. The Capability Requirements (CRs) used to evaluate the interoperability of the application are listed in table 2-1. Interoperability certification of the interface is based on meeting criteria from the CRs.

Table 2-1. SUT Interface Interoperability Status

8. TEST NETWORK DESCRIPTION. The SUT was tested at JITC's Global Information Grid Network Test Facility (GNTF) in a manner and configuration similar to that of the DSN operational environment. Testing the system's required functions and features was conducted using the test configurations depicted in figure 2-2.

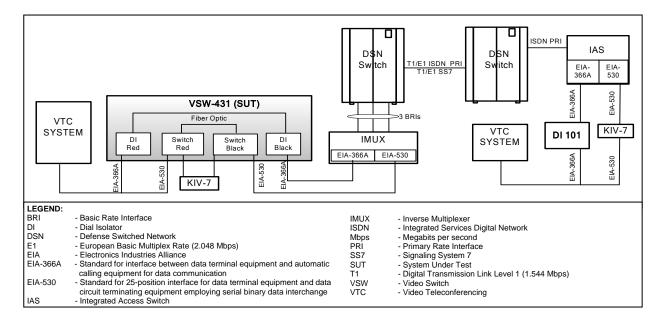

Figure 2-2. SUT Test Configuration

9. SYSTEM CONFIGURATIONS. Table 2-2 provides the system configurations used in the test. Table 2-3 provides the Communications Security (COMSEC) configuration of the KIV-7.

PTRS	- Plain text request-to-send	X09	- Cryptographic traffic key position
PTTR	- Plain text terminal ready	X10	- Cryptographic traffic key position

10. TEST LIMITATIONS. None.

11. TEST RESULTS

- **a. Discussion.** The SUT minimum critical interoperability interface and functional requirements were met through interoperability certification testing conducted at the JITC GNTF. Bonding mode 1 was tested to requirements defined in GSCR, paragraph A8.5 and Federal Telecommunications Recommendation 1080B-2002. Bonding, often referred to as channel aggregation, takes place through inverse multiplexing. Inverse multiplexing takes a high-bandwidth signal and splits it for transport through the network over multiple lower-bandwidth channels. At the receiving end, the multiple, lower-bandwidth signals are recombined into the original high-bandwidth signal. The SUT isolates the dialing stream from the data stream by using an EIA-366 interface DI module along with an EIA-530 interface to pass the data stream. The modality switch allows the user to seamlessly transition from one call type to another with the flip of 2 switches.
- **b. Test Results.** Testing included call strings utilizing KIV-7 encryption devices and call strings without encryption devices. The SUT handled each type of call attempt flawlessly and transparently. Five 384-kilobits per second Bonding mode 1 test calls at different durations (15-minute, 30-minute, 1-hour, and 24-hours) were placed over the test networks shown in figure 2-2. A passed test result was based on 100% of the calls receiving a score of four or better on the subjective quality scale as defined in table 2-4.

Table 2-4. Video and Voice Subjective Quality Scale

Rating	Reference	Definition
1	Unusable	Quality is unusable. Voice and video may be heard and seen but is unrecognizable.
2	Poor	Quality is unusable. Words and phrases are not fully understandable or video cannot be properly identified.
3	Fair	Quality is seriously affected by distortion. Repeating words and phrases are required to convey speech or video is seriously impacted and barely recognizable.
4	Good	Quality is usable. Audio or video is not impaired but some distortion is noticeable
5	Excellent	Quality is unaffected. No discernable problems with either audio or video.
NOTE: Audio and video quality during a conference will receive a subjective rating on the Data Collection Form. A rating of lower than 4 on this reference scale is considered a failure.		

- **c. Summary.** The SUT is certified for joint use in the DSN in accordance with the requirements set forth in reference (c). When connected to the interfaces certified in this letter, the SUT was transparent to the switching systems or lines interfaced, causing no degradation of service or negative impact, and met all the critical interoperability requirements.
- **12. TEST AND ANALYSIS REPORT.** No detailed test report was developed, in accordance with the Program Manager's request. JITC distributes interoperability information via the JITC Electronic Report Distribution (ERD) system, which uses

Unclassified-But-Sensitive Internet Protocol Router Network (NIPRNet) e-mail. More comprehensive interoperability status information is available via the JITC System Tracking Program (STP). The STP is accessible by .mil/gov users on the NIPRNet at https://stp.fhu.disa.mil. Test reports, lessons learned, and related testing documents and references are on the JITC Joint Interoperability Tool (JIT) at https://jit.fhu.disa.mil (NIPRNet), or https://jit.fhu.disa.mil (SIPRNet). Information related to DSN testing is on the Telecom Switched Services Interoperability (TSSI) website at http://jitc.fhu.disa.mil/tssi.
